

eSamithi — How the System Works

eSamithi is a digital platform for Sri Lankan community welfare societies (මරණාධාර හා සුභසාධක සමිති). It keeps each society's member register, contributions, loans and notices in one safe place — and puts them in every member's pocket. This document explains, in plain language, where everything runs and how the pieces fit together.

Architecture overview · Version 1.3.0 · July 2026 · Azynta Technologies

Members use the mobile app

Free on Google Play. A member sees their own contributions, loans and deposits, reads society notices with instant notifications, shows a digital membership card with a QR code, and trades within the society on **Puruka** — in Sinhala or English.

The society office uses the desktop app

Officers manage the member register, record payments and loans, prepare reports and letters, and publish notices — exactly the books the society already keeps, minus the paperwork.

The operator uses the admin console

The platform team brings new societies on board in minutes, watches the health of every server, and can assist a society's office when asked — with every support action recorded in an audit log.

The system at a glance

Everything encrypted (HTTPS)

Each society gets its own locked database

2 cloud servers — one for daily service, one as the control room

Published on Google Play (v1.3.0)

Real push notifications

Full Sinhala + English

Audited operator access

No ads · no data selling · no trackers

Where everything runs

The complete deployment map

every server, container, module and scheduled job — as running on 16 July 2026

What the software is made of

the software architecture view — three layers, plus protections built into every layer

THE APPS — WHAT PEOPLE SEE

📱 Member mobile app (Android)

- Contributions, loans & deposits
- Notices with push notifications
- Digital membership card + QR
- Puruka — society marketplace
- Requests to the office

💻 Office desktop app

- Member register & enrolment
- Payments, loans, deposits, funds
- Meetings, letters & reports
- Publish notices & broadcasts
- Works offline-friendly at the office

🖥️ Operator console (web)

- Fleet dashboard — all societies
- Onboarding wizard (minutes, not days)
- Health, reports & announcements
- Support workspace (with consent, audited)

THE SERVICES — THE ENGINES BEHIND THE APPS

⚙️ Samithi service (one on each server)

Everything a society needs day to day: secure sign-in for members and staff, all record-keeping, notice publishing and notification sending, Puruka listings, photo storage. Each request is served strictly from that society's own database — societies never see each other.

🕒 Platform service (control room only)

Runs the fleet: the society **directory** that turns a join code into the right server, fully automated onboarding of new societies (database created, keys issued, registry updated), health monitoring of every server, and operator sign-in protected by two-step verification.

THE DATA — ONE LOCKED ROOM PER SOCIETY

🗄️ Society databases (MySQL)

Every society's records live in a **separate database with its own key** — like separate locked filing rooms in the same building. A fault or mistake in one society can never touch another's records.

🗄️ Maranadhara Samithi

🗄️ Demo society

🗄️ Society C...

📁 Platform records & registry

The master list of societies and servers, operator accounts, health history, and the audit log. Each server also keeps a small "address book" of the societies it hosts.

Built into every layer

🔒 **Encryption everywhere.** All traffic uses HTTPS. PINs are stored scrambled — no one can read them, not even us.

🔑 **Isolation.** One database per society, with its own credentials and keys.

🔍 **Accountability.** Operator support access requires two-step sign-in and lands in a permanent audit log the society can see.

🔄 **Always up to date.** App improvements arrive automatically — over-the-air for the mobile app, an update feed for the desktop.

🌐 **Two languages.** Sinhala and English through every screen.

🛡️ **Safety nets.** Daily backups, health monitoring, and a documented way back for every change.

Two everyday journeys how the pieces work together, step by step

A member joins their society

A notice reaches every member

Why it is built this way

- **Trust:** societies handle members' life savings and bereavement funds — isolation and encryption are non-negotiable.
- **Growth without surgery:** a new society is onboarded by the console in minutes; new servers join the fleet the same way.
- **Safe change:** every feature is proven on the testbed before it touches the production server real societies rely on.
- **Simple for people:** members need only a join code, their NIC and a PIN — no email, no passwords, no forms.
